## SPECIFICATION

## CYCLIC AMINE CCR3 ANTAGONIST

## 5 Technical Field

The present invention relates to a CCR3 antagonist which can be expected to have effects as a remedies and/or a prophylactics against diseases, for whose progress and maintenance the increase and tissue infiltration of eosinophils, basophils, activated T-cells and the like play main rolls, for  
10 example, allergic diseases such as asthma, allergic rhinitis, atopic dermatitis, urticaria, contact dermatitis and allergic conjunctivitis, inflammatory bowel diseases such as ulcerative colitis and Crohn disease, eosinophilia, eosinophilic gastroenteritis, eosinophilic enteropathy, eosinophilic fasciitis, eosinophilic granuloma, eosinophilic pustular folliculitis, eosinophilic pneumonia,  
15 eosinophilic leukemia and the like, or AIDS (acquired immunodeficiency syndrome) caused by the infection of HIV (human immunodeficiency virus).

## Background Art

In recent years, a concept that the essential pathosis of allergic  
20 diseases such as asthma is chronic inflammation has been established, and the accumulation of eosinophils at an inflammatory region is especially thought to be one of the principal characteristics of the diseases (refer to, for example, Busse, W. W. J. Allergy Clin. Immunol., 1998, 102, S17-S22; Takao Fujisawa, Gendai Iryo, 1999, 31, 1297, and so on). For example, when an antibody  
25 against intercellular adhesion molecule-1 (ICAM-1) was administered into a simian asthmatic model, the accumulation of eosinophils was inhibited, and the manifestation of a late asthmatic response was controlled. Thereby, the importance of the eosinophils in allergic diseases was strongly suggested (Wegner, C.D. et al., Science, 1990, 247, 456).

30 Eotaxin was identified as a specific chemotactic factor causing the accumulation / chemotaxis of eosinophil (refer to, for example, Jose, P. J., et. al., J. Exp. Med., 1994, 179, 881; Garcia-Zepeda, E. A. et al., Nature Med., 1996, 2, 449; Ponath, P. D. et al., J. Clin. Invest., 1996, 97, 604; Kitaura, M. et al., J. Biol. Chem., 1996, 271, 7725, and so on). Further, it was elucidated that  
35 eotaxin bound to a CCR3 receptor expressed on eosinophil to display the action, and it is also known that chemotactic factors such as RANTES (abbreviation of

regulated upon activation normal T-cell expressed and secreted), MCP-2 (abbreviation of monocyte chemoattractant protein-2), MCP-3 (abbreviation of monocyte chemoattractant protein-3), and MCP-4 (abbreviation of monocyte chemoattractant protein-4) can exhibit the same actions as that of the eotaxin through CCR3, although the action potencies of the chemotactic factors are weaker than that of the eotaxin (refer to, for example, Kitaura, M. et al., J. Biol. Chem., 1996, 271, 7725; Daugherty, B. L. et al., J. Exp. Med., 1996, 183, 2349; Panath, P. D. et al., J. Exp. Med., 1996, 183, 2437; Hiath, H. et al., J. Clin. Invest., 1997, 99, 178; Patel, V. P. et al., J. Exp. Med., 1997, 185, 1163; Forssmann, U. et al., J. Exp. Med. 185, 2171, 1997, and so on).

Not only an action for causing chemotaxis but also actions related to the activation of eosinophils, such as the enhancement in the expression of adhesion molecule receptor (CD11b) (refer to, for example, Tenscher, K. et al., Blood, 1996, 88, 3195, and so on), the stimulation in the production of active oxygen (refer to, for example, Elsner, J. et al., Eur. J. Immunol., 1996, 26, 1919, and so on), the stimulation in the release of EDN (abbreviation of eosinophil-derived neurotoxin) [refer to El-Shazly, et al., Int. Arch. Allergy Immunol., 1998, 117 (suppl. 1), 55], have been reported as the actions of the eotaxin on the eosinophils. It has also been reported that eotaxin has an action for stimulating the release of eosinophils and their precursor cells from bone marrow into blood (refer to, for example, Palframan, R. T. et al., Blood, 1998, 91, 2240, and so on).

Many reports show that eotaxin and CCR3 play important roles on allergic diseases such as asthma. For example, the inhibition of eosinophil infiltration with an anti-eotaxin antibody in a mouse asthma model (refer to Gonzalo, J. -A. et al., J. Clin. Invest., 1996, 98, 2332), the inhibition of eosinophil infiltration with an anti-eotaxin antiserum in a mouse dermal allergy model (refer to Teixeira, M. M. et al., J. Clin. Invest., 1997, 100, 1657), the inhibition in the formation of pulmonary granuloma with an anti-eotaxin antibody in a mouse model (refer to Ruth., J. H. et al., J. Immunol., 1998, 161, 4276), the inhibition of eosinophil infiltration in an asthma model and an interstitial keratitis model using eotaxin gene-deficient mice, respectively, (refer to Rothenberg, M. E. et al., J. Exp. Med., 1997, 185, 785), the increase in the expression of eotaxin and CCR3 in the bronchus of an asthmatic patient at a genetic level and a protein level in comparison with a healthy subject (refer to Ying, S. et al., Eur. J. Immunol., 1997, 27, 3507), and the increase in the

expression of eotaxin in the nasal subepithelium tissue of a chronic sinusitis patient (refer to Am. J. Respir. Cell Mol Biol., 1997, 17, 683), have been reported.

5 Additionally, since it has been reported that eotaxin is expressed in large amounts in the inflammatory regions of Crohn disease and ulcerative colitis which is an inflammatory large bowel disease (refer to Garcia-Zepeda E.A. et al., Nature Med., 1996, 2, 449), it can be understood that the eotaxin also plays important roles on the diseases.

10 From these data, it is strongly suggested that the eotaxin accumulates and activates the eosinophils in the lesion regions through CCR3 and thereby deeply participates in the initiation progression and maintenance of diseases in which the deep participation of the eosinophils in the progresses of the lesions can be supposed, for example, allergic diseases such as asthma, allergic rhinitis, atopic dermatitis, urticaria, contact dermatitis, and allergic  
15 conjunctivitis, inflammatory bowel diseases such as ulcerative colitis and Crohn disease, eosinophilia, eosinophilic gastroenteritis, eosinophilic enteropathy, eosinophilic fasciitis, eosinophilic granuloma, eosinophilic pustular folliculitis, eosinophilic pneumonia and eosinophilic leukemia.

20 Further, since they have been reported that CCR3 receptors reveal not only on eosinophils but also on basophils and Th2 lymphocytes and that the increase in the intracellular calcium ion concentrations of the cells and the chemotaxis of the cells are caused by the eotaxin, the eotaxin and the CCR3 are supposed to have relations with the initiation progression and maintenance of the diseases in which the cells participate, such as allergic  
25 diseases, also by the accumulation and activation of the cells (refer to, for example, Sallusto, F. et al., Science, 1997, 277, 2005; Gerber, B. O. et al., Current Biol., 1997, 7, 836; Sallusto, F. et al., J. Exp. Med., 1998, 187, 875; Ugucioni, M. et al., J. Clin. Invest., 1997, 100, 1137; Yamada, H. et al., Biochem Biophys. Res. Commun., 1997, 231, 365; and so on).

30 Thereby, a compound for inhibiting the binding of eotaxin to the CCR3, namely, a CCR3 antagonist, is supposed to be useful as a medicine for treating and/or preventing diseases such as allergic diseases and inflammatory intestinal diseases by inhibiting the action of a CCR3 ligand represented by the eotaxin on a target cell, but a medicine having such the action is now not  
35 known.

In addition, since it has been reported that HIV-1 (human

immunodeficiency virus-1) utilizes CCR3 on the infection of a host cell, a CCR3 antagonist is supposed to be useful for a medicine for treating or preventing AIDS (acquired immunodeficiency syndrome) caused by the infection of the HIV (refer to, for example, Choe, H. et al., Cell, 1996, 85, 1135; Doranz, B.J. et al., Cell, 1996, 85, 1149).

Recently, it has been reported that xanthene-9-carboxamide derivatives (refer to WO 9804554), piperazine or piperidine derivatives (refer to EP 903349; WO 0029377; WO 0031033; WO 0035449; WO 0035451; WO 0035452; WO 0035453; WO 0035454; WO 0035876; WO 0035877), pyrrolidine derivatives (refer to WO 0031032), phenylalanine derivatives (refer to WO 9955324; WO 9955330; WO 0004003; WO 0027800; WO 0027835; WO 0027843), and other low molecular compounds (refer to WO 9802151) have antagonistic activities to CCR3 receptors. However, these compounds are different from the compounds used in the present invention. And, the compounds used in the present invention are the same as the compounds mentioned in WO 9925686, but it is not known that these compounds have antagonistic activities to CCR3 receptors.

#### Disclosure of the Invention

Thereby, the object of the present invention is to provide low molecular compounds, which have activities to inhibit that the ligand of CCR3, such as eotaxin, binds to the CCR3 on a target cell.

Another object of the present invention is to provide a method for treating and/or preventing, with a CCR3 antagonist, such a disease that the binding of the ligand of CCR3, such eotaxin, to the CCR3 on a target cell is an etiology.

The studies have further been continued to accomplish the present invention.

Namely, in accordance with the present invention, there is provided a

medicine, which contains, as an active ingredient, a compound represented by the following formula (I), a pharmaceutically acceptable acid addition salt thereof or a pharmaceutically acceptable C<sub>1</sub> to C<sub>6</sub> alkyl addition salt thereof, and which has a CCR3 antagonistic action,

20 [Example 1] Assay of the inhibitory potency of a compound against the rise in the intracellular calcium concentration of CCR3 expressing cells by eotaxin

The inhibitory potency of the compound of the present invention against the rise in the intracellular calcium concentration was assayed using K562 cells stably expressing a CCR3 receptor by the following method.

25 A 1 mM Fura 2 acetoxymethyl ester (Dojin Kagaku Co.) was added to a suspension obtained by suspending the CCR3 expressing K562 cells in a 10 mM HEPES-containing HBSS solution, and then incubated at 37°C for 30 minutes. The suspension was excited with 340 nm and 380 nm light, and the 340/380 ratio was monitored to measure the intracellular calcium  
30 concentration. Human eotaxin (0.5 μg/ml) was used as an agonist, and the inhibitory potency of the compound was assayed by treating the CCR3 expressing K562 cells with the compound at five minutes before the stimulation using the eotaxin, assaying the intracellular calcium concentration of the treated CCR3 expressing K562 cells, and then calculating the inhibition  
35 potency (%) by the use of the following expression.

$$\text{Inhibition rate (\%)} = \{1 - (A - B) / (C - B)\} \times 100$$

(A: an intracellular calcium concentration, when the cells were treated with the compound and then stimulated with the eotaxin; B: an intracellular calcium concentration, when the cells were not stimulated with the eotaxin; C: an intracellular calcium concentration, when the cells were not treated with the compound but stimulated with the eotaxin).

[Example 2] Assay of inhibitory potency against the binding of eotaxin to a CCR3 expressing cells membrane fraction

10 A cell membrane fraction prepared from human CCR3 expressing K562 cells was suspended in an assay buffer solution (25 mM HEPES, pH 7.6, 1 mM CaCl<sub>2</sub>, 5 mM MgCl<sub>2</sub>, 0.5% BSA) at a concentration of 0.5 mg/mL to prepare the cell membrane fraction suspension. A test compound was diluted with the assay buffer solution to prepare the test compound solution. [125I]-labeled  
15 human eotaxin (Amasham Co.) was diluted with the assay buffer solution at a concentration of 1  $\mu$ Ci/mL to prepare the labeled ligand solution. 25  $\mu$ L of the test compound solution, 25  $\mu$ L of the labeled ligand solution and 50  $\mu$ L of the cell membrane fraction suspension were sequentially injected into each well of a 96 well microplate coated with 0.5% BSA, stirred (100  $\mu$ L of the  
20 reaction solution), and then incubated at 25°C for 90 minutes.

After the reaction was finished, the reaction solution was filtered with the 96 well filter plate (Millipore Inc.) in which the filter was previously immersed in a 0.5% polyethylenimine solution, and the filter was washed with 150  $\mu$ L of a cold washing buffer solution (assay buffer +0.5M NaCl) four times  
25 (150  $\mu$ L of the cold washing buffer solution was added and then filtered). After the filter was dried with air, 25  $\mu$ L of a liquid scintillator was added to each well, and the radioactivity retained in the membrane fraction on the filter was measured with a TopCounter (Packard Co.).

The inhibitory potency of the test compound against the binding of the  
30 human eotaxin to the CCR3 membrane fraction was calculated, wherein a count on the addition of 100 ng of non-labeled human eotaxin in stead of the test compound was subtracted, and a count on the non-addition of the test compound was 100%.

35 Inhibition (%) = {1-(A·B) / (C·B)} × 100

(A: a count, when the test compound was added; B: a count, when 100 ng of the non-labeled human eotaxin was added; C: a count, when only [<sup>125</sup>I]-labeled human eotaxin was added).

5 When the inhibitory activities of the cyclic amine derivatives used in the present invention were assayed, the inhibitory activities of typical compounds in the present example were approximately equivalent to the inhibitory activities measured in Example 1.

#### Utilizability in industry

10 The medicine containing as an active ingredient the cyclic amine compound, the pharmaceutically acceptable acid addition salt thereof or the pharmaceutically acceptable C<sub>1</sub> to C<sub>6</sub> alkyl addition salt thereof, of the present invention, or the medicine for treating or preventing diseases in which CCR3 participates, has an activity for inhibiting the action of the ligand of the CCR3,  
15 such as eotaxin, to a target cell as the CCR3 antagonist. Thereby, the medicine is useful as a medicine for treating and/or preventing diseases for whose progress and maintenance the tissue infiltration of eosinophils, basophils, activated T-cells and so on play main rolls, for example, allergic diseases such as bronchial asthma, allergic rhinitis, atopic dermatitis,  
20 urticaria, contact dermatitis and allergic conjunctivitis, inflammatory bowel diseases such as ulcerative colitis, Crohn disease and so on. Further, the medicine is useful as a medicine for treating and/or preventing AIDS by the HIV-1 infection-inhibiting activity based on the CCR3 antagonism.
